

**CSE 102**  
**Introduction to Analysis of Algorithms**  
**Review Problems From CMPS 101**

1. Determine whether the following statements are true or false. For each true statement, give a proof. For each false statement, give a counterexample.

- a.  $(\log(n))^{100} = \omega(n^{0.01})$ .
- b. If  $f(n) = \Theta(g(n))$ , then  $L = \lim_{n \rightarrow \infty} (f(n)/g(n))$  exists and  $0 < L < \infty$ .
- c.  $o(g(n)) \cap \Omega(g(n)) = \emptyset$  for any function  $g(n)$ .
- d. If  $f(n) = O(g(n))$ , then  $2^{f(n)} = O(2^{g(n)})$ .

2. Determine a tight asymptotic bound for the solution to the recurrence  $T(n) = 9T(n/2) + n^{3.16}$ .

3. Trace execution of Dijkstra's algorithm on the weighted digraph pictured below, taking vertex  $r$  as the source.

4. Consider the following algorithm which does nothing but waste time:

WasteTime(n) (pre:  $n \geq 1$ )

1. if  $n > 1$
2.     for  $i = 1$  to  $n^3$
3.         waste 2 units of time
4.     for  $i = 7$  to  $7$
5.         WasteTime( $\lceil n/2 \rceil$ )
6.     waste 3 units of time

- a. Write a recurrence formula which gives the amount of time  $T(n)$  wasted by this algorithm.
- b. Show that when  $n$  is an exact power of 2, the solution to this recurrence relation is given by  $T(n) = 16n^3 - \frac{1}{2} - \frac{31}{2}n^{\lg(7)}$ , and hence  $T(n) = \Theta(n^3)$ .

5. Prove that all trees on  $n$  vertices have  $n - 1$  edges. Do this by (a) induction on the number of vertices, and (b) by induction on the number of edges.
6. Use Induction to show that  $\forall n \geq 1: T(n) \leq 12n$ , and hence  $T(n) = O(n)$ , where  $T(n)$  is defined by the recurrence formula

$$T(n) = \begin{cases} 1 & 1 \leq n < 3 \\ 2T(\lfloor n/3 \rfloor) + 4n & n \geq 3 \end{cases}$$

7. Determine a solution to the following recurrence

$$T(n) = \begin{cases} 7 & 1 \leq n < 3 \\ 2T(\lfloor n/3 \rfloor) + 5 & n \geq 3 \end{cases}$$

Problems 8 and 9 refer to the following graphs:

**Figure 1:**

**Figure 2:**

**Figure 3:**

8. Trace Breadth First Search on the following graphs.
- The graph in figure 1, with 1 as the source.
  - The directed graph in figure 2 with 1 as source.
9. Trace Depth First Search on the following graphs.
- The graph in figure 1.
  - The graph in figure 2.
  - The graph in figure 3. Determine a topological sort of the vertices.
  - The transpose of the graph in figure 2. Determine the strongly connected components of the graph in figure 2, and draw its component graph. Also determine a topological sort of the strong components.
10. Let  $T$  be a binary tree. Let  $n(T)$  denote the number of nodes in  $T$  and  $h(T)$  denote the height of  $T$ . Show that  $h(T) \geq \lceil \lg(n(T)) \rceil$ .
11. Let  $G$  be a weighted connected graph (undirected) with distinct edge weights. Show that  $G$  contains a *unique* minimum weight spanning tree.
12. The following weighted graph contains three minimum weight spanning trees. Run Kruskal's algorithm to find one, then find the other two by inspection.
