

CSE 16

Lab Assignment 4

The *Hereditarily Finite Sets* are the finite sets that can be constructed from "nothing". Starting with the empty set (denoted here by \emptyset), we form the following sequence of sets.

n (decimal)	n (binary)	$H(n)$
0	0	\emptyset
1	1	$\{\emptyset\}$
2	10	$\{\{\emptyset\}\}$
3	11	$\{\emptyset, \{\emptyset\}\}$
4	100	$\{\{\{\emptyset\}\}\}$
5	101	$\{\emptyset, \{\{\emptyset\}\}\}$
6	110	$\{\{\emptyset\}, \{\{\emptyset\}\}\}$
7	111	$\{\emptyset, \{\emptyset\}, \{\{\emptyset\}\}\}$
8	1000	$\{\{\emptyset, \{\emptyset\}\}\}$
9	1001	$\{\emptyset, \{\emptyset, \{\emptyset\}\}\}$
10	1010	$\{\{\emptyset\}, \{\emptyset, \{\emptyset\}\}\}$
11	1011	$\{\emptyset, \{\emptyset\}, \{\emptyset, \{\emptyset\}\}\}$
12	1100	$\{\{\{\emptyset\}\}, \{\emptyset, \{\emptyset\}\}\}$
13	1101	$\{\emptyset, \{\{\emptyset\}\}, \{\emptyset, \{\emptyset\}\}\}$
14	1110	$\{\{\emptyset\}, \{\{\emptyset\}\}, \{\emptyset, \{\emptyset\}\}\}$
15	1111	$\{\emptyset, \{\emptyset\}, \{\{\emptyset\}\}, \{\emptyset, \{\emptyset\}\}\}$
16	10000	$\{\{\{\{\emptyset\}\}\}\}$

The initial term is $H(0) = \emptyset$, the empty set. Observe that each subsequent term in the sequence contains, as its members, certain earlier terms in the sequence. The n^{th} term $H(n)$ can be obtained recursively by expressing n in binary, then finding those positions i in the corresponding binary numeral that are occupied by 1's. The elements of $H(n)$ are those sets $H(i)$.

For instance, we obtain $H(5)$ by reading the bit string 101 from right to left (least to most significant). The 1's are in positions 0 and 2, so we include term 0, exclude term 1, and include term 2. Thus

$$H(5) = \{H(0), H(2)\} = \{\emptyset, \{\{\emptyset\}\}\}$$

We compute $H(13)$ in slightly more detail. The binary numeral for 13 is $(1101)_2$. Labeling the positions in this string from right to left, we have

$$\begin{array}{rcl} \text{bit:} & 1 & 1 & 0 & 1 \\ \text{position:} & 3 & 2 & 1 & 0 \end{array}$$

Since the 1's are in positions 0, 2, and 3 we have

$$H(13) = \{H(0), H(2), H(3)\} = \{\emptyset, \{\{\emptyset\}\}, \{\emptyset, \{\emptyset\}\}\}$$

In general, if $x = (x_k, x_{k-1}, \dots, x_1, x_0)$ is the bit string representing n in base-2, then

$$H(n) = \{H(i) \mid 0 \leq i \leq k \text{ and } x_i = 1\}$$

Your goal in this project will be to print out $H(n)$ for all n in the range $0 \leq n \leq 500$. There are basically two methods for accomplishing this. The top-down method is to compute $H(n)$ recursively as described above. First express n as a bit string, then recursively compute $H(i)$ for each position i in the bit string for n which contains 1. The base of the recursion is the empty set $H(0) = \emptyset$.

The bottom-up method is to produce binary numerals for the numbers 0 through n , initialize $H(0) = \emptyset$, then proceed to compute $H(i)$ for $i = 1$ to n by examining the binary numeral for i , and previously computed terms.

There may of course be other methods. You will turn in a file called `lab4.txt` containing a brief paragraph describing your method, then the sets $H(n)$ for $0 \leq n \leq 500$. We list the sets $H(0)$ through $H(20)$ below with the required formatting.

Observe that each element, other than $H(0)$, appears as a comma separated list of prior terms, enclosed in curly braces, with a space after each comma. You will represent the empty set as the number 0. We have presented it in this document as 0 in the consolas font: `0`. **You are not responsible for the font** since you are turning in a plain text file which contains no such meta data. Thus your listing will contain the characters: 0, {, }, comma, space, newline, and nothing else. In particular, you will not label each line with a base-10 numeral.

Clearly this last lab assignment for CSE 16 is the most challenging of the quarter. Submit the file `lab4.txt` in the usual manner on Gradescope by the due date. As usual, start early and ask plenty of questions.
