## Subclassing and Inheritance

### Problem of Multiple Inheritance

if a class inherits from two parent classes, both having a method called  $m()$ , which version of  $m()$  does the class get.

Ex. Multiple Inheritance, Py

Built in function `super()` iterates over the method resolution order list for the class. The first class in the mro list having a method of the required name is the inherited.

Ex. for class4:

mro: class4, class2, class3, class1, object

The class 'type' has a member method called mro() which returns a list giving the method resolution order.

Ex Person.py

# A non-contrived example

## Defn

A directed graph (digraph) is a pair of sets  $G = (V, E)$  where  $V \neq \emptyset$  and  $E \subseteq V \times V$ , i.e. a set of ordered Pairs of vertices

$(x, y)$

(origin)  $\textcircled{x} \longrightarrow \textcircled{y}$  (terminus)

we define:

adjacency, incidence, walk, trail, Path  
cycle (closed walk, closed trail),

reachability, Path length, distance  
between vertices, and SSSP Problem

Just as before.

Recall: undirected:  
not allowed

" "

But in directed case:

allowed

"

Defn

$y$  is reachable from  $x$  iff  $G$   
contains a directed  $x-y$  Path

Defn

$G$  is called strongly connected iff  
for all  $x, y \in V(G)$ :  $y$  is reachable  
from  $x$  and  $x$  is reachable from  $y$ .

[6]

more generally, a subset  $S \subseteq V(G)$  is strongly connected iff for all  $x, y \in S$ :  $x$  is reachable from  $y$ , and  $y$  from  $x$ .

Defn:

$S \subseteq V(G)$  is called a strongly connected component iff

- (1)  $S$  is strongly connected  
and (2)  $S$  is maximal w.r.t. Property (1).

SCCs:

- $\{1\}$
- $\{4\}$
- $\{2, 3, 5\}$
- $\{6, 7, 8\}$

## Adj list representation

|             | indegree | out-degree |
|-------------|----------|------------|
| 1 : 2, 4    | 0        | 2          |
| 2 : 3       | 3        | 1          |
| 3 : 2, 5    | 2        | 2          |
| 4 : 4       | 3        | 1          |
| 5 : 2, 4    | 2        | 2          |
| 6 : 3, 5, 8 | 1        | 3          |
| 7 : 6       | 1        | 1          |
| 8 : 7       | 1        | 1          |

### note

reachable() } run exactly same  
BFS()

Exercise create a stand-alone  
class representing a directed graph.

Then see!
