1.1 EXERCISES

Solve each system in Exercises 1–4 by using elementary row operations on the equations or on the augmented matrix. Follow the systematic elimination procedure described in this section.

1. \[ x_1 + 5x_2 = 7 \]
   \[ -2x_1 - 7x_2 = -5 \]
   \[ 5x_1 + 7x_2 = 11 \]

2. \[ 2x_1 + 4x_2 = -4 \]

3. Find the point \((x_1, x_2)\) that lies on the line \(x_1 + 5x_2 = 7\) and on the line \(x_1 - 2x_2 = -2\). See the figure.

4. Find the point of intersection of the lines \(x_1 - 5x_2 = 1\) and \(3x_1 - 7x_2 = 5\).

Consider each matrix in Exercises 5 and 6 as the augmented matrix of a linear system. State in words the next two elementary row operations that should be performed in the process of solving the system.

5. \[
\begin{bmatrix}
1 & -4 & 5 & 0 & 7 \\
0 & 1 & -3 & 0 & 6 \\
0 & 0 & 1 & 0 & 2 \\
0 & 0 & 0 & 1 & -5 \\
\end{bmatrix}
\]

6. \[
\begin{bmatrix}
1 & -6 & 4 & 0 & -1 \\
0 & 2 & -7 & 0 & 4 \\
0 & 0 & 1 & 2 & -3 \\
0 & 0 & 3 & 1 & 6 \\
\end{bmatrix}
\]

In Exercises 7–10, the augmented matrix of a linear system has been reduced by row operations to the form shown. In each case, continue the appropriate row operations and describe the solution set of the original system.

7. \[
\begin{bmatrix}
1 & 7 & 3 & -4 \\
0 & 1 & -1 & 3 \\
0 & 0 & 0 & 1 \\
0 & 0 & 1 & -2 \\
\end{bmatrix}
\]

8. \[
\begin{bmatrix}
1 & -4 & 9 & 0 \\
0 & 1 & 7 & 0 \\
0 & 0 & 2 & 0 \\
\end{bmatrix}
\]

9. \[
\begin{bmatrix}
1 & -1 & 0 & 0 & -4 \\
0 & 1 & -3 & 0 & -7 \\
0 & 0 & 1 & -3 & -1 \\
0 & 0 & 0 & 2 & 4 \\
\end{bmatrix}
\]

10. \[
\begin{bmatrix}
1 & -2 & 0 & 3 & -2 \\
0 & 1 & 0 & -4 & 7 \\
0 & 0 & 1 & 0 & 6 \\

\end{bmatrix}
\]

Solve the systems in Exercises 11–14.

11. \[ x_2 + 4x_3 = -5 \]
    \[ x_1 + 3x_2 + 5x_3 = -2 \]
    \[ 3x_1 + 7x_2 + 7x_3 = 6 \]

12. \[ x_1 - 3x_2 + 4x_3 = -4 \]
    \[ 3x_1 - 7x_2 + 7x_3 = -8 \]
    \[ -4x_1 + 6x_2 - x_3 = 7 \]

13. \[ x_1 - 3x_3 = 8 \]
    \[ 2x_1 + 2x_2 + 9x_3 = 7 \]
    \[ x_2 + 5x_3 = -2 \]

14. \[ x_1 - 3x_2 = 5 \]
    \[ -x_1 + 2x_2 + 5x_3 = 2 \]
    \[ x_2 + x_3 = 0 \]

Determine if the systems in Exercises 15 and 16 are consistent. Do not completely solve the systems.

15. \[ x_1 + 3x_3 = 2 \]
    \[ x_2 - 3x_4 = 3 \]

    \[ 3x_1 + 7x_4 = -5 \]

16. \[ x_1 - 2x_4 = -3 \]
    \[ 2x_2 + 2x_3 = 0 \]
    \[ x_3 + 3x_4 = 1 \]
    \[ -2x_1 + 3x_2 + 2x_3 + x_4 = 5 \]

17. Do the three lines \(x_1 - 4x_2 = 1,\) \(2x_1 - x_2 = -3,\) and \(-x_1 - 3x_2 = 4\) have a common point of intersection? Explain.

18. Do the three planes \(x_1 + 2x_2 + x_3 = 4,\) \(x_2 - x_3 = 1,\) and \(x_1 + 3x_2 = 0\) have at least one common point of intersection? Explain.

In Exercises 23 and 24, key statements from this section are either quoted directly, restated slightly (but still true), or altered in some way that makes them false in some cases. Mark each statement True or False, and justify your answer. (If true, give the approximate location where a similar statement appears, or refer to a definition or theorem. If false, give the location of a statement that has been quoted or used incorrectly, or cite an example that shows the statement is not true in all cases.) Similar true/false questions will appear in many sections of the text.

An important concern in the study of heat transfer is to determine the steady-state temperature distribution of a thin plate when the temperature around the boundary is known. Assume the plate shown in the figure represents a cross section of a beam, with negligible heat flow in the direction perpendicular to the plate. Let $T_1, \ldots, T_4$ denote the temperatures at the four interior nodes of the mesh in the figure. The temperature at a node is approximately equal to the average of the four nearest nodes—

33. Write a system of four equations whose solution gives estimates for the temperatures $T_1, \ldots, T_4$.

34. Solve the system of equations from Exercise 33. [Hint: To speed up the calculations, interchange rows 1 and 4 before starting "replace" operations.]

---

SOLUTIONS TO PRACTICE PROBLEMS

1. a. For “hand computation,” the best choice is to interchange equations 3 and 4. Another possibility is to multiply equation 3 by $1/5$. Or, replace equation 4 by its sum with $-1/5$ times row 3. (In any case, do not use the $x_2$ in equation 2 to eliminate the $4x_2$ in equation 1. Wait until a triangular form has been reached and the $x_2$ terms and $x_4$ terms have been eliminated from the first two equations.)

b. The system is in triangular form. Further simplification begins with the $x_4$ in the fourth equation. Use the $x_4$ to eliminate all $x_4$ terms above it. The appropriate
THEOREM 2
Existence and Uniqueness Theorem
A linear system is consistent if and only if the rightmost column of the augmented matrix is not a pivot column—that is, if and only if an echelon form of the augmented matrix has no row of the form
\[
[0 \cdots 0 \ b] \quad \text{with } b \text{ nonzero}
\]
If a linear system is consistent, then the solution set contains either (i) a unique solution, when there are no free variables, or (ii) infinitely many solutions, when there is at least one free variable.

The following procedure outlines how to find and describe all solutions of a linear system.

**USING ROW REDUCTION TO SOLVE A LINEAR SYSTEM**

1. Write the augmented matrix of the system.
2. Use the row reduction algorithm to obtain an equivalent augmented matrix in echelon form. Decide whether the system is consistent. If there is no solution, stop; otherwise, go to the next step.
3. Continue row reduction to obtain the reduced echelon form.
4. Write the system of equations corresponding to the matrix obtained in step 3.
5. Rewrite each nonzero equation from step 4 so that its one basic variable is expressed in terms of any free variables appearing in the equation.

Suppose experimental data are represented by a set of points in the plane. An interpolating polynomial for the data is a polynomial whose graph passes through every point. In scientific work, such a polynomial can be used, for example, to estimate values between the known data points. Another use is to create curves for graphical images on a computer screen. One method for finding an interpolating polynomial is to solve a system of linear equations.

Solutions to Practice Problems

1. The reduced echelon form of the augmented matrix and the corresponding system are

\[
\begin{bmatrix}
1 & 0 & -8 & -3 \\
0 & 1 & -1 & -1
\end{bmatrix}
\]

The general solution of the system of equations is the line of intersection of the two planes.

\[
\begin{align*}
    x_1 &= -3 + 8x_3 \\
    x_2 &= -1 + x_3 \\
    x_3 &= \text{free}
\end{align*}
\]

Note: It is essential that the general solution describe each variable, with any parameters clearly identified. The following statement does not describe the solution:

\[
\begin{align*}
    x_1 &= -3 + 8x_3 \\
    x_2 &= -1 + x_3 \\
    x_3 &= 1 + x_2 \quad \text{Incorrect solution}
\end{align*}
\]

This description implies that \( x_2 \) and \( x_3 \) are both free, which certainly is not the case.
